Restaurant Management System

Project Description

- The Restaurant Management System (RMS) is a software solution designed to streamline restaurant operations by digitalizing table management, menu handling, order processing, and financial tracking. The system provides an intuitive interface for restaurant staff to efficiently manage orders and assign them to tables, ensuring accurate billing and improved customer service. Additionally, it features a dashboard for tracking daily, weekly, and monthly earnings, offering insights into restaurant performance.

Scope of the Project

The aim of this project is to streamline restaurant operations by:

- Providing secure access to the system through login functionality.
- Simplifying earnings tracking with detailed reports.
- Allowing full control over the restaurant profile, tables, and menu.
- Providing a straightforward order management system linked to tables, ensuring precise billing and efficient table clearance.

Impact of the Project

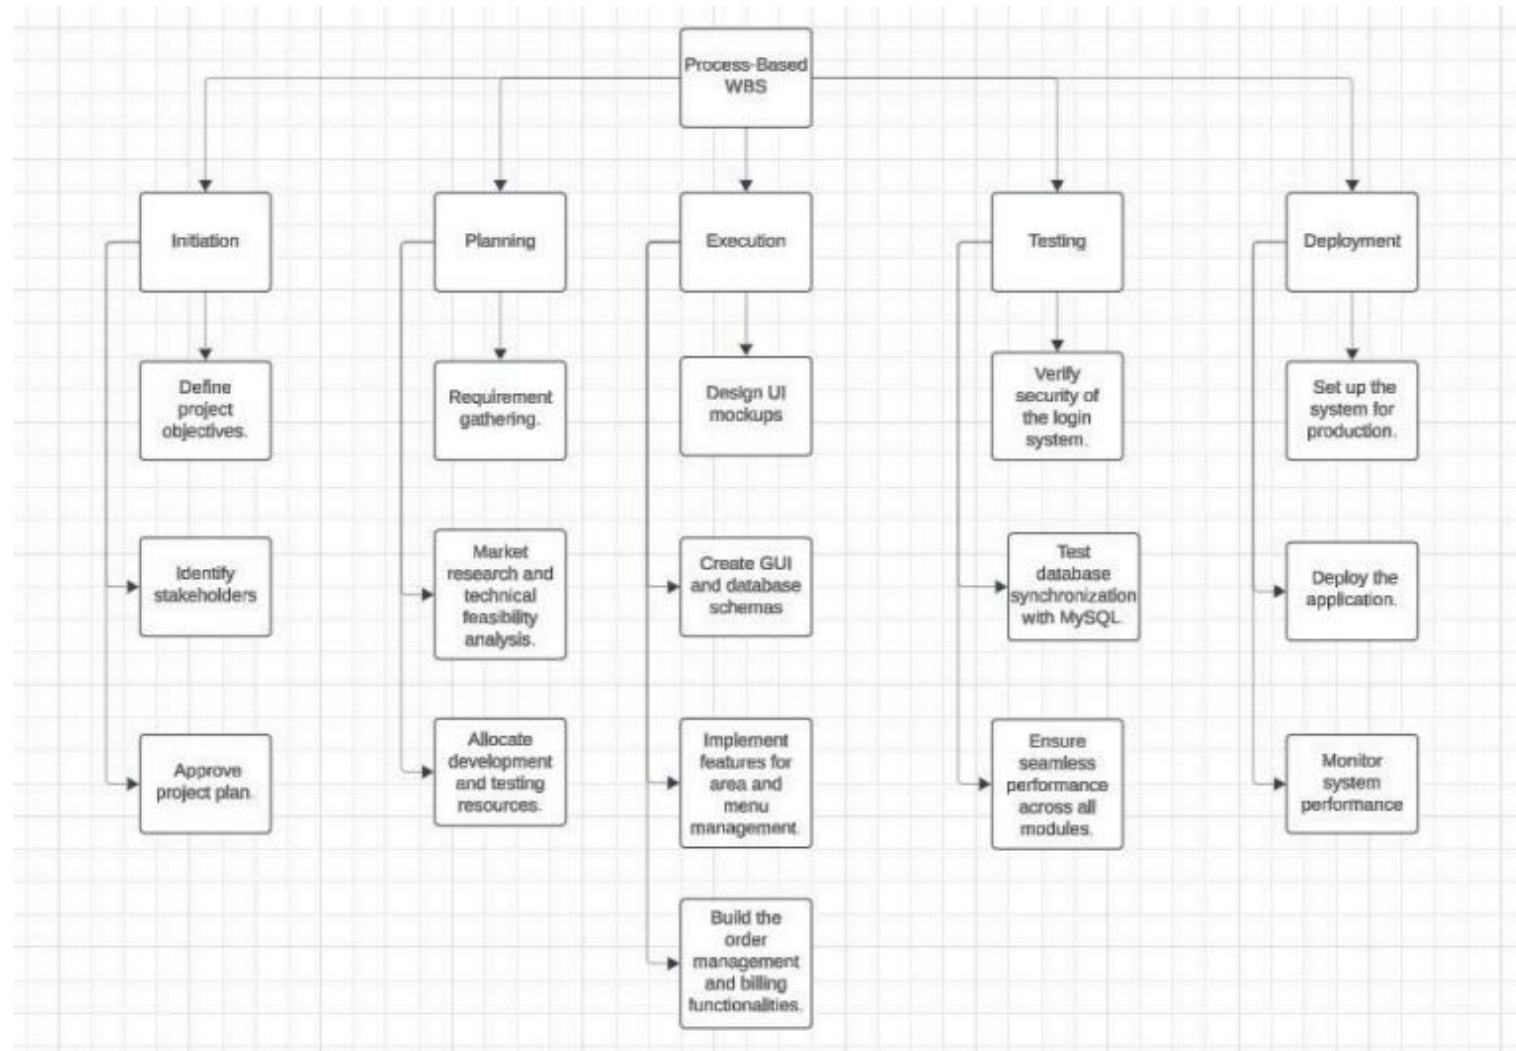

- Economic: Enhances operational efficiency and reduces costs associated with manual processes.
- Social: Improves customer satisfaction with faster billing and accurate orders.
- Technological: Introduces a user friendly interface along with seamless database integration for centralized and scalable data storage.
- Environmental: Encourages paperless operations through digital storage of transaction and order data.

SRS Document

Functional Requirements:

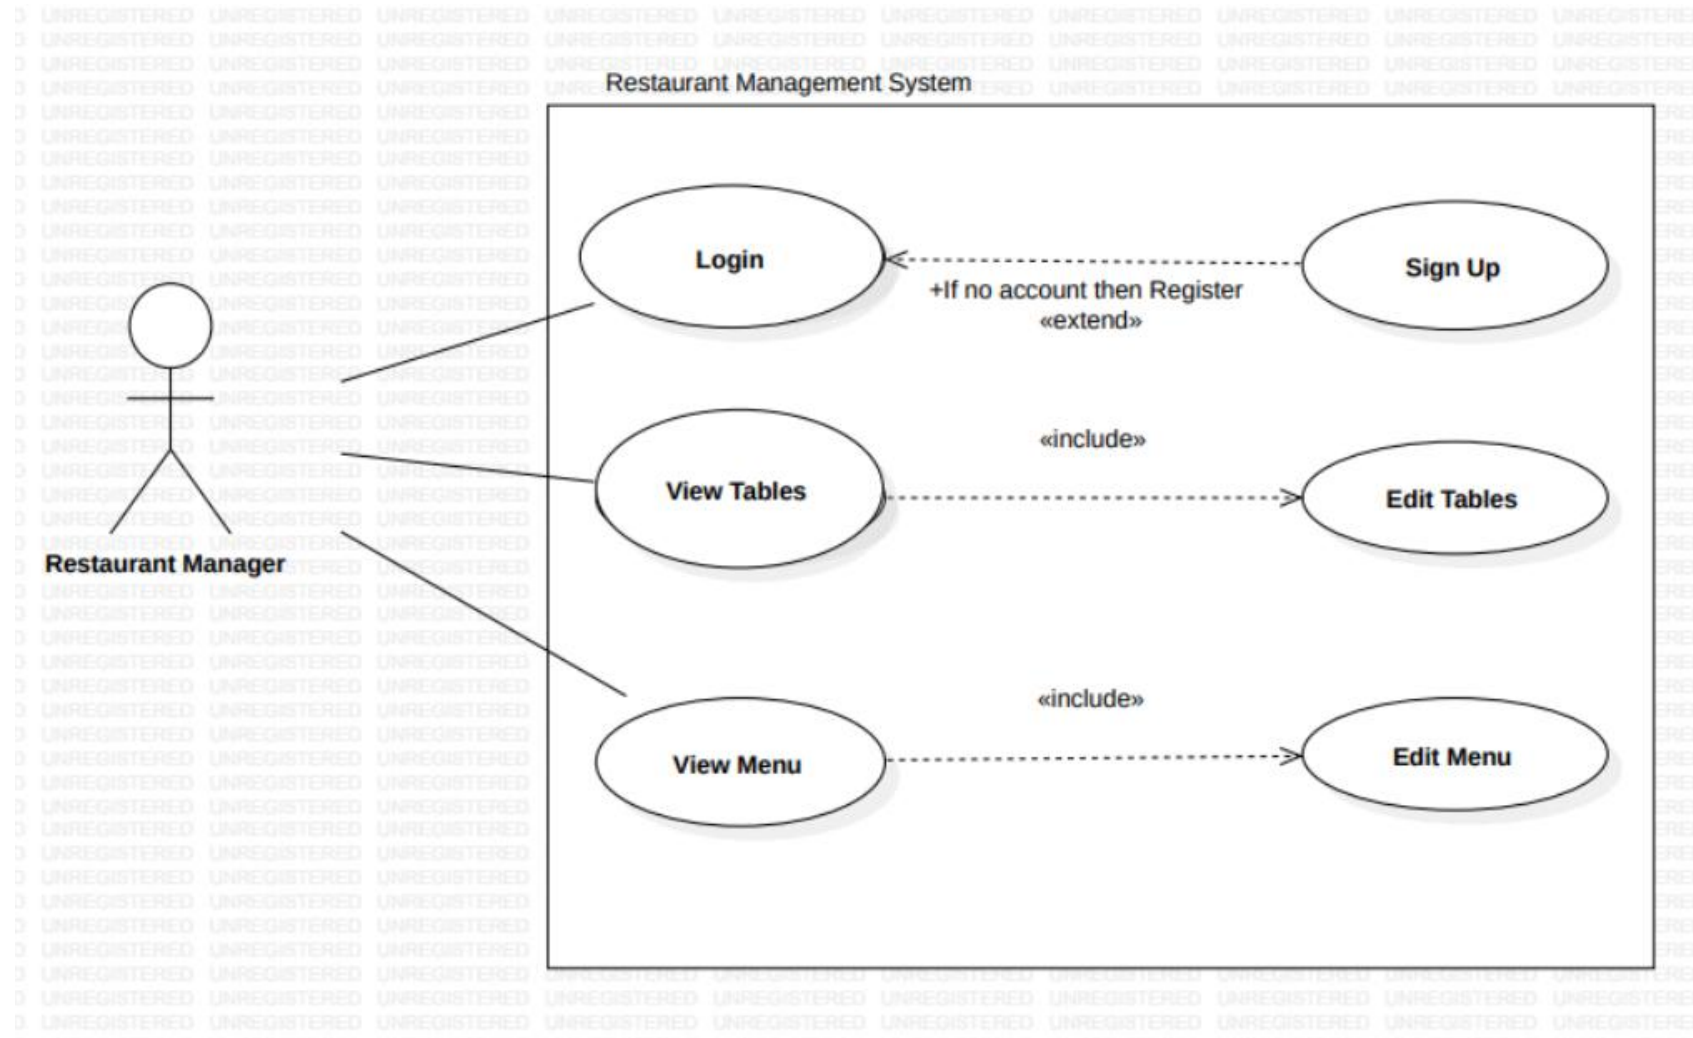

- 1. User Authentication:** The system must allow restaurant managers and staff to log in securely using a username and password.
- 2. Table Management:** The system should enable adding, updating, and removing tables, ensuring orders are correctly assigned.
- 3. Menu Management:** Restaurant managers should be able to add, modify, and remove menu items along with their prices.
- 4. Bill Processing:** The system must allow staff to take orders, assign them to tables, and generate bills within the software.
- 5. Financial Tracking:** The system should provide daily, weekly, and monthly earnings reports through the dashboard.

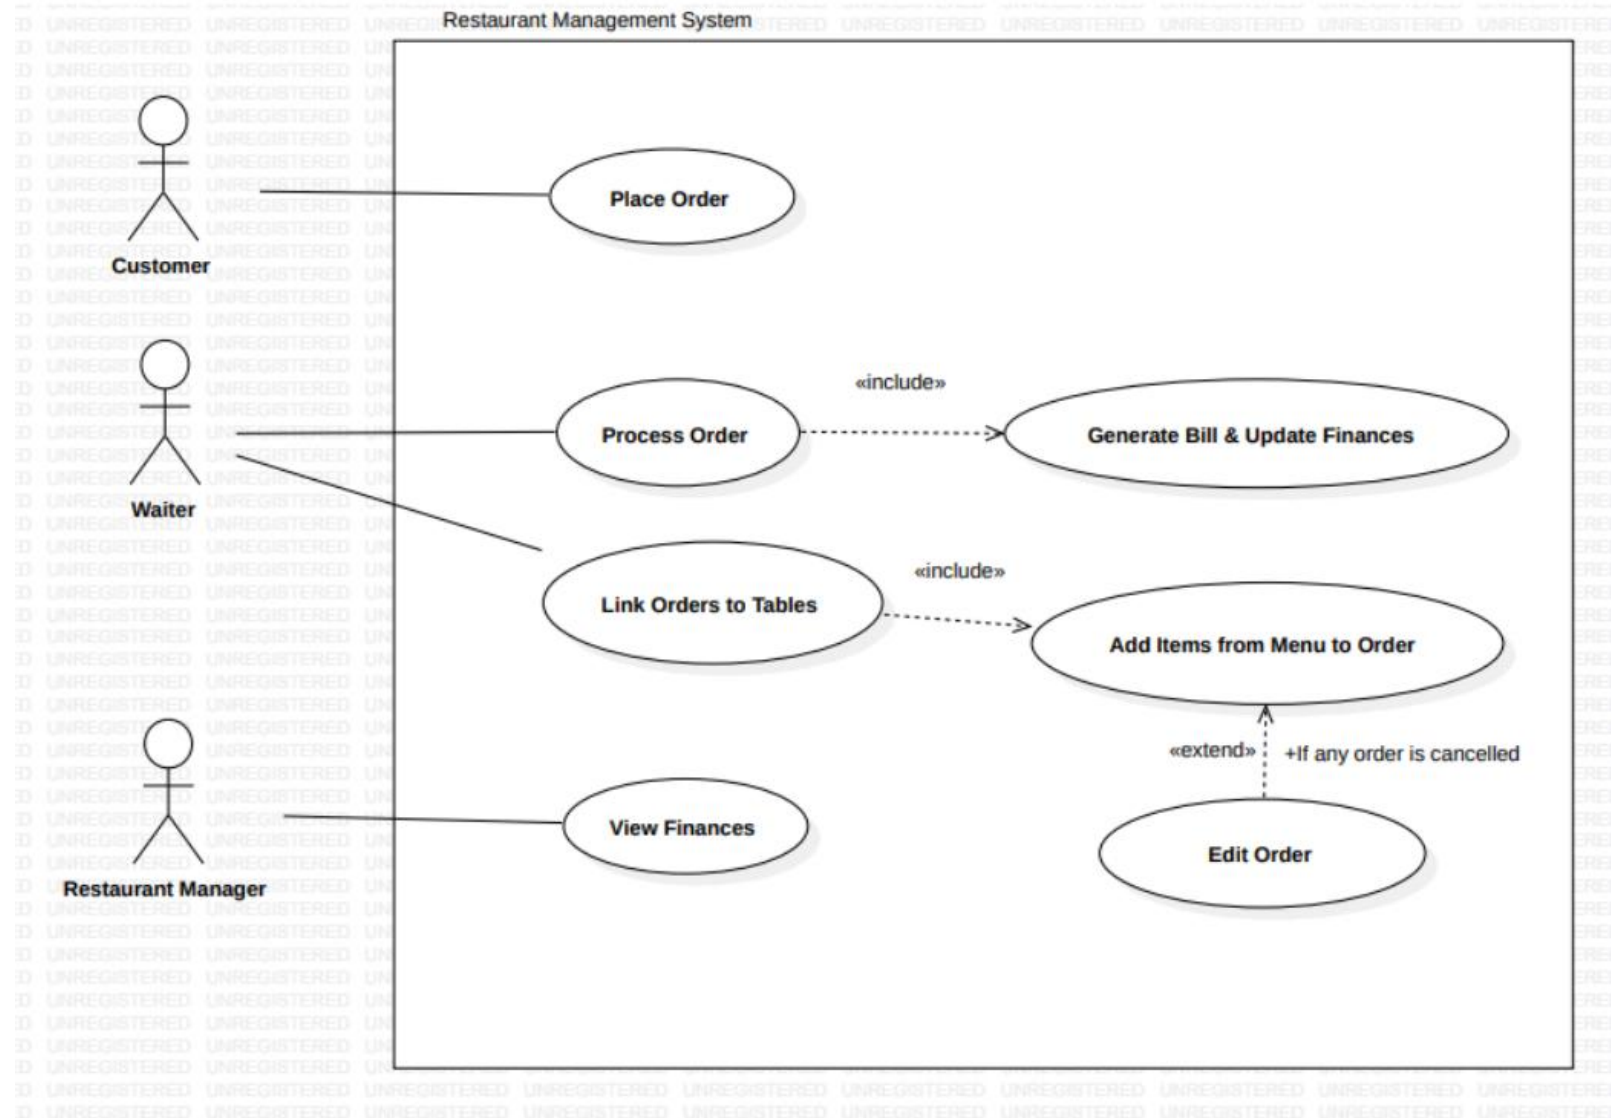

Non-Functional Requirements:

1. **Performance:** The system should handle multiple concurrent users without significant delays.
2. **Security:** All user data, including login credentials and transactions, must be encrypted and secured.
3. **Usability:** The system should have an intuitive and user-friendly interface for easy navigation.
4. **Reliability:** The system must ensure accurate order and billing data storage, preventing loss due to system crashes.
5. **Scalability:** The system should allow future expansion, including cloud integration for multi-branch restaurants.

Testing

- **Test Case ID:** TC001
- **Test Scenario:** Verify login functionality with valid and invalid credentials.
- **Test Case Description:** Ensure that the login system allows authorized users and prevents unauthorized access.
- **Test Steps:**
 1. Open the login page.
 2. Enter the username.
 3. Enter the password.
 4. Click the "Login" button.
- **Test Data:**
 - Valid Case: Username: admin123, Password: Secure@123
 - Invalid Case: Username: wronguser, Password: wrongpass

Test Expected Result:

- If valid credentials are entered, the user should be redirected to the dashboard.
- If invalid credentials are entered, an error message "Invalid Username or Password" should appear.

Actual Result:

- Valid credentials: Redirected to dashboard.
- Invalid credentials: Got error message.

Pass/Fail: Pass

- **Test Case ID:** TC002
- **Test Scenario:** Verify that waiters can place customer orders correctly.
- **Test Case Description:** Ensure that orders are assigned to tables and menu items are added accurately.
- **Test Steps:**
 1. Log in as a waiter.
 2. Select a table.
 3. Add menu items to the order.
 4. Confirm the order.
- **Test Data:**
 - Valid Case: Table Number: T5, Menu Items: Burger (x2), Fries (x1), Coke (x2)
 - Invalid Case: No table selected, No items added

Test Expected Result:

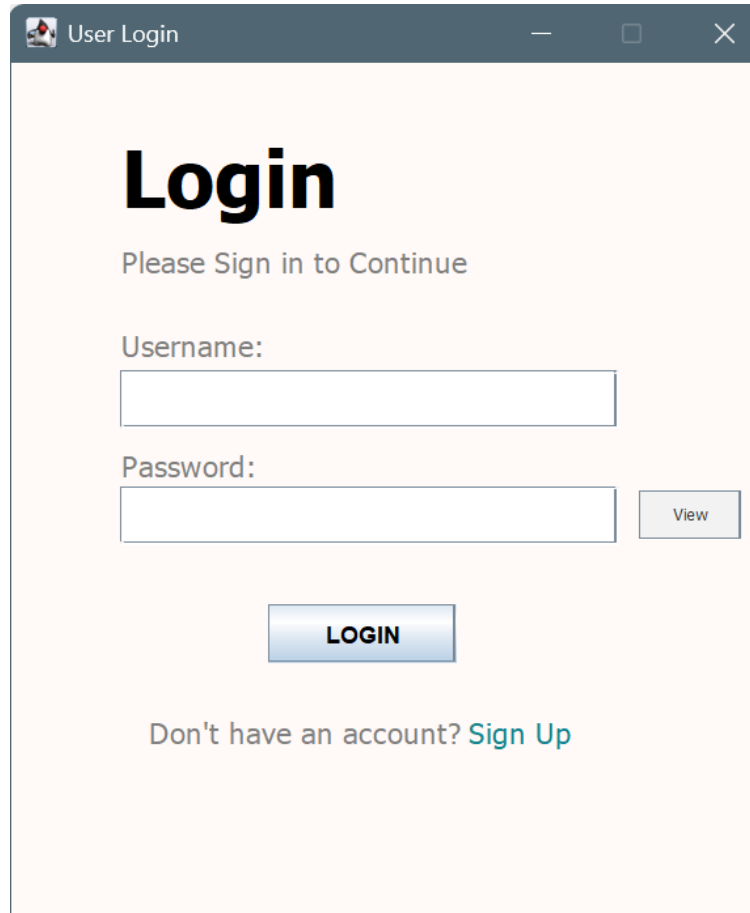

- If valid data is entered, the system should create an order and assign it to the selected table.
- If no table is selected, an error "Please select a table" should appear.
- If no items are added, an error "Order must contain at least one item" should appear.

Actual Result:

- Order created successfully and assigned to table.
- Error messages displayed correctly for invalid cases.

Pass/Fail: Pass

Project – UI Screenshots

A screenshot of a web application window titled "User Login". The window has a dark gray title bar with standard minimize, maximize, and close buttons. The main content area has a light orange background. At the top, the word "Login" is displayed in a large, bold, black font. Below it, the text "Please Sign in to Continue" is shown in a smaller, gray font. There are two input fields: "Username:" and "Password:". The "Password:" field has a "View" button next to it. Below the input fields is a blue "LOGIN" button. At the bottom, there is a link that says "Don't have an account? Sign Up".
